Proper Maintenance for Your New Yixing Teapot

Yixing teapots are historically intended for use with black and oolong teas. They also work wonderfully with green and white teas, but it is important to allow the water to cool down a bit to around 85-90 °C (185 °F) before pouring the water into the teapot. That said, Yixing teapots are fired at low heat, and can withstand sudden temperature changes without cracking, making them extremely durable and perfect for the tea connoisseur.

The excellent porous nature of Yixing teapots allow them to absorb tiny amounts of tea into the pot during brewing, developing a coating that retains the flavor and colour of the tea. This means your Yixing teapot will continue to age, and get better with every brewing!

Therefore, it is very important that yixing teapots should never be washed using detergents. Please wash thoroughly with water only and then allow to air dry.

Please follow the manufacturer's guidelines. The teapot is not intended to be used directly on a stove. Please use a kettle to heat and transfer the water.
